

SMART air

Electronic variable speed vacuum controller

A **SMART air** system controls the operating vacuum level of your milking machine without the use of a conventional vacuum regulator. It compensates for vacuum use by increasing or decreasing the vacuum pump speed on demand.

- A **SMART air** system will control your milking vacuum with absolute precision
- A **SMART air** system will help **reduce your power bills (savings of up to 49%)**. No longer will your vacuum pump operate continuously at full speed
- This **SMART air** system has been approved by us for use with “Blower” type and “Water Ring” vacuum pumps
- A **SMART air** controller protects your electric motor from overload and other electrical failure
- A **SMART air** system provides built in “soft start” for large motors up to 15kw, 3ph, 400v
- A **SMART air** uses internationally recognised ABB control equipment
